

## Hannah Ricks - Reflection - CSS - Project 2

### Name – Reflection – CSS – Project #2

**Instructions:** The goal of your reflection document is to 1) explain your design choices, and 2) explain the techniques you used in the program. Be sure to use proper terminology (for example elements, opening tag, closing tag, etc.) in your reflection. Demonstrate you understand the design concepts and the software you used to create your site. Make sure you proofread your reflection, so it is free of errors.

**Explain your use of HTML and how your site conforms to HTML standards and accessibility standards.**

**Explain how you added style to your page using CSS. You can include a table with a list of what you included and a quick explanation of how (included below is a table with the minimum requirements). Be sure to explain if you used div tags, etc. to facilitate the styling.**

CSS style	Where it is	Explanation
format text (headers and body text)	menu: h1 line 28 H2 lines 33, 39, 45	Using different format texts to put emphasis on titles
consistent navigation and design across pages (so we can tell it is all the same website)	Lines 12-18	Simple modern looking navigation across all pages the same
background and colors	CSS lines 12-16	<b>I used very simple comforting colors as that's how I want people to perceive my restaurant as.</b>
work with margins, padding, and header and footers to achieve a nice consistent layout on your site	Margin line 14, 24, 32 Padding line 44, 50, 210 Header (all pages) 11-25 Footer bottom of all pages	I added padding and margins to help add space between different items
include a flex box nav bar that is well designed (paying close attention to the flow and the wrap)	Nav flex lines 12-18 also shown in CSS 38-59	Navigation bar is set to flex for a nice design
include a grid design in your site that drives your layout - (this will be used more later on as well as you move onto responsive designs, so set it up well on this project)	Index grid css 116-156 Menu grid css 192-322	Grid was difficult at first but after calling everything up and breaking it down I got it to work... I used it for menu items as well as on the

contact page, the about page, and the home page

<b>Include any items above the minimum</b>	Button	Index Line 32
	Form	Index Line 55

Linked email and telephone

Contact Line 46 47

**Explain your layout and visuals and why it is professional. Two things you are required to explain here include: 1) your color palette and how it conforms to web standards (show screenshot of contrast report), and 2) grid and flexbox - and how you utilized each in your layout of your project.**

**I used grid for my menu to make it more visually pleasing rather than just a list as it was before. I also used flex in my project for my navigation make it more accessible as well as visually pleasing**

**If you went beyond the minimum requirements for this assignment, please explain here how you did so.**

**I used both grid and flex box in different ways because they can help portray information differently. I also added a form which we hasn't learned about in class.**

**Show a screenshot of your site validation for your pages (minimum of 4 pages). \***

*\*Note: Validate both the html and css.*

**Include source information for pictures used.**

**I used pixabay and unsplash for my photos**

**Explain your revised submission:**

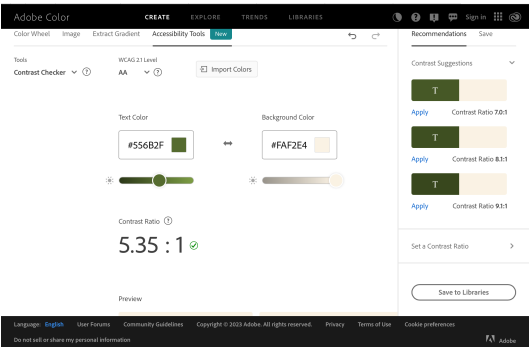

- 1) Explain the feedback you received in class**
- 2) Explain your thorough review of your own work. Then, be sure to illustrate how you elevated the project from the first draft to the revised submission (both through suggestions from feedback day and your own review of your work).**

**I was told to add more content so I attempted to do that... was also given hints on why my grid wasn't working and I ended up figuring it out which was very helpful. I was also told to make my images the same sizes in the grid so they would look better so I attempted to do that as well and had to switch some picture and change them a little.**

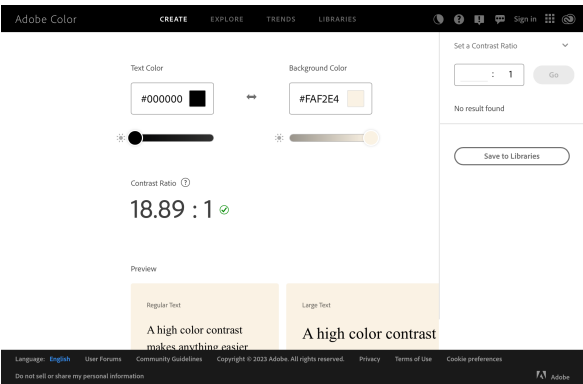

**There is still filler text that I tried to fill but it is difficult when it is not a real site. My site has greatly elevated since the last html submission and has many changes from the first css submission as well.... Such as organizing my CSS page to make it easier to find things and to make sure I am calling up classes and ids correctly.**

**I wanted to use simple and comforting colors on my website, nothing too crazy or bright. I also made sure all the different ways I used these colors contrasted well for all users on different devices**
